INDUSTRIAL PROPANE SERVICE RELEASES A CYLINDER EVACUATION SYSTEM

Byron, MI – March, 2018 – Industrial Propane Service Inc. (IPS) has recently released their “Cylinder Evacuation System” (CES) – allowing propane operators to safely recover LPG product.

“There’s a ton of waste when you evacuate LPG product from 20-lb tanks and forklift cylinders using traditional methods,” commented IPS President Jeff Vandemark. “So, we decided to do something about it.”

When using the proprietary CES method of evacuation you can safely transfer the LPG product to domestic tanks as well as bobtails.

Most systems feature a 320-gallon recovery tank, compressor, purge and vent piping, pressure gauges and back-flow monitoring. In addition, all units are equipped with explosion-proof electrical connections.

“We’ve tried to design a solution that solves all the problems you might encounter when you use old, outdated methods for tank evacuation” comments Mr. Vandemark. “Our CES setup is easy to use, safe, and extremely cost-effective.”
